Chapter 1

Class Index

1.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

FileParser	3
Line	3
LineList	4
Plane	4
planeList	5
PlaneWithLines	5
planeWithLinesList	6
Point	6
PointList	7
Rotator	7
ThreeDModel	7
ThreeDModelGenerator	8
TwoDModel	9
TwoDModelGenerator	9
TwoDView	10

Chapter 2

Class Documentation

2.1 FileParser Class Reference

```
#include <FileParser.h>
```

Public Member Functions

- [ThreeDModel _3DModelInput](#) (std::string filename)
function which takes a 3D model as input
- [TwoDModel _2DModelInput](#) (std::string filename)
function which takes a 2D model as input
- void **parseFile** (std::string filename, int choice)

2.1.1 Detailed Description

A class representing a file parser

The documentation for this class was generated from the following file:

- FileParser.h

2.2 Line Class Reference

```
#include <geometry.h>
```

Public Member Functions

- [Point getFirstPoint](#) ()
Accessor function to get the first end point.
- [Point getSecondPoint](#) ()
Accessor function to get the second end point.
- [Point * getArrayPoints](#) ()
Accessor function to get the array of end points.
- void [setFirstPoint](#) ([Point](#) p1)
Mutator function to set the first end point.
- void [setSecondPoint](#) ([Point](#) p2)
Mutator function to set the second end point.

2.2.1 Detailed Description

A class to represent a line in space

The documentation for this class was generated from the following file:

- geometry.h

2.3 LineList Class Reference

Public Member Functions

- [Line](#) * [getLines](#) ()
Accessor function which gets an array of lines.
- int [getSize](#) ()
Accessor function to get size of array.
- void [setLines](#) ([Line](#) *lines)
Mutator function to set array of lines.
- void [setSize](#) (int size)
Mutator function to set size of array.
- void **remove** ([Line](#) l)

The documentation for this class was generated from the following file:

- Lists.h

2.4 Plane Class Reference

```
#include <geometry.h>
```

Public Member Functions

- float [getA](#) ()
Accessor function to get a.
- float [getB](#) ()
Accessor function to get b.
- float [getC](#) ()
Accessor function to get c.
- float [getD](#) ()
Accessor function to get d.
- float * [getArrayABCD](#) ()
Accessor function to get array of lines.
- void **setA** (float a)
- void **setB** (float b)
- void **setC** (float c)
- void **setD** (float d)

2.4.1 Detailed Description

A class to represent a plane in space

A class to represent a plane and the lines lying on it

The documentation for this class was generated from the following file:

- geometry.h

2.5 planeList Class Reference

Public Member Functions

- [Plane * getplanes \(\)](#)
Accessor function which gets an array of planes.
- [int getSize \(\)](#)
Accessor function to get size of array.
- [void setplanes \(Plane *planes\)](#)
Mutator function to set array of planes.
- [void setSize \(int size\)](#)
Mutator function to set size of array.

The documentation for this class was generated from the following file:

- Lists.h

2.6 PlaneWithLines Class Reference

Public Member Functions

- [Plane getPlane \(\)](#)
Accessor function to get plane.
- [Line * getArrayLines \(\)](#)
Accessor function to get array of lines.
- [int getNumLines \(\)](#)
Accessor function to get number of lines.
- [LineList getLines \(\)](#)
- [void setPlane \(Plane p\)](#)
- [void addLine \(Line l\)](#)

The documentation for this class was generated from the following file:

- Lists.h

2.7 planeWithLinesList Class Reference

Public Member Functions

- [PlaneWithLines](#) * [getPlaneWithLines](#) ()
Accessor function which gets an array of planeWithLines.
- int [getSize](#) ()
Accessor function to get size of array.
- void [setPlaneWithLines](#) ([PlaneWithLines](#) *p)
Mutator function to set array of planeWithLines.
- void [setSize](#) (int size)
Mutator function to set size of array.

The documentation for this class was generated from the following file:

- Lists.h

2.8 Point Class Reference

```
#include <geometry.h>
```

Public Member Functions

- float [getX](#) ()
Accessor function to get the x coordinate of point.
- float [getY](#) ()
Accessor function to get the y coordinate of point.
- float [getZ](#) ()
Accessor function to get the z coordinate of point.
- void [setX](#) (float x)
Mutator function to get the x coordinate of point.
- void [setY](#) (float y)
Mutator function to get the y coordinate of point.
- void [setZ](#) (float z)
Mutator function to get the z coordinate of point.
- float * [getArrayCoors](#) ()
Accessor function to get the array of coordinates of point.

2.8.1 Detailed Description

A class to represent a point in space

The documentation for this class was generated from the following file:

- geometry.h

2.9 PointList Class Reference

```
#include <Lists.h>
```

Public Member Functions

- [Point](#) * [getPoints](#) ()
Accessor function which gets an array of points.
- int [getSize](#) ()
Accessor function to get size of array.
- void [setPoints](#) ([Point](#) *points)
Mutator function to set array of points.
- void [setSize](#) (int size)
Mutator function to set size of array.

2.9.1 Detailed Description

A class representing a list of points

The documentation for this class was generated from the following file:

- Lists.h

2.10 Rotator Class Reference

Public Member Functions

- void [setThreeDModel](#) ([ThreeDModel](#) model)
Mutator function to set [ThreeDModel](#).
- [ThreeDModel](#) [rotate](#) ([ThreeDModel](#) model, std::string axis, float angle)
function to rotate the [ThreeDModel](#)

The documentation for this class was generated from the following file:

- Rotator.h

2.11 ThreeDModel Class Reference

```
#include <model.h>
```

Public Member Functions

- [Point](#) * [getPoints](#) ()
Accessor function to get the vertices.
- [Line](#) * [getLines](#) ()
Accessor function to get the lines.
- [Plane](#) * [getPlanes](#) ()
Accessor function to get the surfaces.
- void **setPoints** ([Point](#) *p)
- void **setLines** ([Line](#) *l)
- void **setPlanes** ([Plane](#) *p)
- int **getPointSize** ()
- int **getLineSize** ()
- int **getPlaneSize** ()
- void **setPointSize** (int s)
- void **setLineSize** (int s)
- void **setPlaneSize** (int s)

2.11.1 Detailed Description

A class representing a 3D model containing the vertices, edges and surfaces

The documentation for this class was generated from the following file:

- [model.h](#)

2.12 ThreeDModelGenerator Class Reference

Public Member Functions

- [ThreeDModelGenerator](#) ([TwoDModel](#) model)
Input function to get the 2D model.
- void [PossibleVerticesConstructor](#) ()
This function returns a list of possible vertices in a array of point objects.
- void [PossibleEdgesConstructor](#) ()
This function returns a list of possible edges in a array of line objects.
- [planeWithLinesList](#) [PossibleSurfacesConstructor](#) ()
This function returns a list of possible surfaces in a array of plane objects.
- bool [DuplicatePlaneChecker](#) ([Plane](#) p1, [Plane](#) p2)
This function checks if two given planes are duplicate or not.
- void [PossibleClosedLoopFacesConstructor](#) ([planeWithLinesList](#) possibleSurfaces)
This function returns a list of possible closed loops in a array of plane objects.
- [ThreeDModel](#) * [PossibleObjectsConstructor](#) ()
This function returns a list of possible objects in a array of [ThreeDModel](#) objects.
- [ThreeDModel](#) [PossibleObjectsCombiner](#) ([ThreeDModel](#) *)
This function returns a [ThreeDModel](#) object after combining possible subobjects.
- [ThreeDModel](#) [output](#) ()
This function returns the final [ThreeDModel](#) object.
- void **PossibleClosedLoopConstructor** ([PlaneWithLines](#) possiblePlane)

The documentation for this class was generated from the following file:

- [ThreeDModelGenerator.h](#)

2.13 TwoDModel Class Reference

```
#include <model.h>
```

Public Member Functions

- [TwoDView getFrontView \(\)](#)
Accessor function to get the front view.
- [TwoDView getTopView \(\)](#)
Accessor function to get the top view.
- [TwoDView getSideView \(\)](#)
Accessor function to get the side view.
- void **setFrontView** ([TwoDView](#) v)
- void **setTopView** ([TwoDView](#) v)
- void **setSideView** ([TwoDView](#) v)

2.13.1 Detailed Description

A class representing a 2D model containing the three views

The documentation for this class was generated from the following file:

- model.h

2.14 TwoDModelGenerator Class Reference

```
#include <TwoDModelGenerator.h>
```

Public Member Functions

- [TwoDModelGenerator](#) ([ThreeDModel](#) model)
Input function to get the 3D model.
- [Point _3Dto2DPoint](#) ([Point](#) p, string plane)
- [Point * _3Dto2DPoints](#) ([Point](#) *pointArray, string plane, int arraySize)
- [Line * _3Dto2DLine](#) ([Line](#) *lineArray, string plane, int arraySize)
- [TwoDModel output](#) ()
Output function returns a 2D model.

2.14.1 Detailed Description

A class responsible for generating the 2D model

The documentation for this class was generated from the following file:

- TwoDModelGenerator.h

2.15 TwoDView Class Reference

Public Member Functions

- [Point](#) * [getPoints](#) ()
Accessor function to get the array of points.
- [Line](#) * [getLines](#) ()
Accessor function to get the array of lines.
- void **setPoints** ([Point](#) *p)
- void **setLines** ([Line](#) *l)
- int **getPointSize** ()
- int **getLineSize** ()
- void **setPointSize** (int s)
- void **setLineSize** (int s)

The documentation for this class was generated from the following file:

- [view.h](#)
